PROFESSIONAL SUMMARY

- Cybersecurity student at UTS with hands-on experience in network scanning, Python automation and manual web application testing.
- Industry experience across immigration casework, QA, and automation, focused on decreasing manual work, improving documentation, and facilitating compliance for audits and reviews.

EDUCATION

University of Technology Sydney | 2023 - Present

Bachelor of Cybersecurity | ***Full-time***

- **Expected Graduation:** June 2026
- **Relevant Subjects:** Cybersecurity, System Security, Information Security and Management, Cryptography, Digital Forensics, Applying Network Security, Routing and Switching Essentials, Cloud Security (AWS)

PROFESSIONAL EXPERIENCE

Migrate Zone | Jul 2023 - Present

Automation Engineer | Part-time (Dec 2024 - Present)

- Promoted to Automation Engineer to update and streamline internal visa processing workflows and support higher documentation volumes after expansion into the UAE.
- Expanded the internal automation toolkit and consolidated financial audit checks into a single systematic workflow, minimising duplicate checks and manual cross referencing.
- Co-led the redesign and rollout of modular automations for file naming, risk flagging and routing, trimming average case handling time from ~8.0 hours to ~5.3 hours per case, saving about 2.7 hours per case (~35 percent faster), based on a one-week trial with four mixed senior junior teams, two using the new toolkit and two using the old process.
- Developed a prefill tool that structures validated case data into Excel lodgement templates, eliminating repetitive data checks and speeding up internal lodgement preparation.
- Built a lightweight scraping tool to monitor policy update pages so staff do not need to run manual website checks for each case.

Junior Automation Engineer | Part-time (Jul 2023 - Nov 2024)

- Promoted from Administrative Assistant after automating data entry with Python scripts, removing a large portion of manual typing for each case.
- Co-created a collated PDF and OCR based completeness check that reduced manual review time and cut missed or outdated documents and lapsed agreements, catching dozens of document issues per month before lodgement.
- Created simple step by step guides so administrative staff could utilise the toolkit without developer support.

ITonKey | Aug 2024 - Oct 2024

Python Backend Developer Intern | Part-time

- Created Python-based solutions, including an invoicing tool which turned structured data into branded, multi-page PDF invoices employing templated layouts tailored to ITonKey's internal processes.
- Assisted in developing custom software for small business clients, focusing on inventory management systems with stock tracking and basic reporting to minimise loss.

PROJECTS

Cybersecurity Capstone Studio, UTS, 2025

Sentinel (Automated Network Vulnerability Assessment Tool)

- Developed a Python-based tool which scans target subnets with Nmap/NSE and cross-references results with locally indexed NVD CVE data to identify vulnerabilities.
- Increased accuracy by flattening nested Nmap output, handling host level scripts (for example SMB and RDP checks) and adding a CPE mapping table for common services.
- Reduced noise for infrastructure scans by disabling unsuitable OSV results, limiting duplicate CVEs, and exporting findings to a JSON file with documented verification commands.

Migrate Zone, 2024 - 2025

Immigration Case Workflow Automation Toolkit

- Constructed a Python pipeline in a team to ingest staff uploaded case documents, batch merging using Adobe PDF Services, running OCR, and indexing pages for later checks.
- Implemented scan quality checks via OCR text coverage and confidence scores per page to flag low quality or unreadable scans before lodgement.
- Modelled visa subclass document requirements in JSON or Excel and applied rule-based checks on OCR output and file metadata to classify documents, detect missing items, and generate structured JSON or CSV summaries plus merged PDF packs for internal review.

TECHNICAL SKILLS

Technical: Python, Excel, JSON and CSV handling, HTML, CSS, Selenium, Git, GitHub, Jira, Postman, VMware, VirtualBox, Metasploit, Wireshark, Cisco Packet Tracer, Chrome DevTools.
