

OM SHAH

Cybersecurity & Automation Engineer

Sydney, NSW · contact@omshahinfo.com · github.com/0m-5hah · omshahinfo.com

PROFILE

Cybersecurity graduate with three years of experience building production automation and security-focused software. Cut average case-processing time by **34%** at Migrate Zone and independently built EightScope, a live external attack surface monitoring platform.

CORE SKILLS

Security	External attack surface monitoring, vulnerability assessment, Nmap/NSE, Wireshark, DNS and TLS assessment, HTTP security headers
Engineering	Python, REST APIs, PostgreSQL, JSON, OCR and PDF workflows, Excel automation, Git
Platforms	Linux, Windows, VMware

PROFESSIONAL EXPERIENCE

MIGRATE ZONE July 2023 - May 2026

Automation Engineer, Part-time

Promoted from Junior Automation Engineer in December 2024

- Cut average case-processing time from approximately **8.0 hours to 5.3 hours** by co-building Python workflows for document validation, file naming, risk flagging and case routing.
- Combined financial audit checks and Excel prefill into one workflow, reducing duplicate reviews and repetitive data entry.
- Co-developed a PDF collation and OCR process that identified missing, expired and unreadable documents before lodgement.
- Created a government policy monitor and internal guides that allowed non-technical staff to use the automation tools independently.

ITONKEY August 2024 - October 2024

Python Backend Developer Intern, Part-time

- Developed a Python system that converted structured business data into branded, multi-page PDF invoices.
- Contributed stock-tracking and reporting features to an inventory-management platform for small businesses.

SELECTED PRODUCT & PROJECTS

EIGHTSCOPE 2026 - Present

Founder & Lead Developer | eightscope.au

- Built and launched an external attack surface monitoring platform using Python, FastAPI, PostgreSQL, Next.js and TypeScript.
- Designed a safe, target-aware scanner covering domains, hostnames, public IPs and network services, with controls preventing private or reserved targets from being scanned.
- Developed automated security checks across DNS, TLS, HTTP headers, exposed services, public files, technologies and CVE signals.
- Produced prioritised findings with severity, confidence, technical evidence, remediation guidance and scan-to-scan change tracking.

SENTINEL 2025

Automated Network Vulnerability Scanner | UTS Capstone

- Created a Python vulnerability scanner using Nmap and NSE to discover hosts, identify services and surface possible CVE matches.
- Improved fingerprinting across SMB, RDP, nested Nmap output and host-level script results.
- Generated risk-prioritised JSON findings grouped by asset with commands for manual verification.

DNS TUNNELLING DETECTION LAB 2025

Independent Security Lab

- Created an isolated VMware lab to study DNS tunnelling and capture network evidence using Wireshark.
- Produced defensive detection logic based on query entropy, subdomain length, burst timing and repeated-domain behaviour.
- Mapped the behaviour to MITRE ATT&CK T1048.003 and presented the captured PCAP through an interactive browser walkthrough.

EDUCATION

BACHELOR OF CYBERSECURITY 2023 - 2026

University of Technology Sydney

Relevant study: Network Security, System Security, Cloud Security, Digital Forensics, Incident Response and Cyber Threat Intelligence
